Brief title

Generation R Next

Health condition

Growth, Behaviour, Cognitive development, Asthma, Allergy, Maternal health, Fertility

Sponsors and support

Primary sponsor: Erasmus MC

Source(s) of monetary or material Support: Erasmuc MC, European Union, European Research Council, Stichting Erasmus Trustfonds, Stichting Vrienden van het Sophia

Intervention

Outcome measures

Primary outcome

The study focuses on six primary research areas: (1) (future) maternal and paternal health (2) reproductive health (3) growth and physical development of the child, (4) behaviour and cognitive development, (5) asthma, allergy and infections in the child, (6) health care.

Secondary outcome

Study description

Background summary

Generation R Next is population-based cohort study from preconception onwards, studying women and their partners already before conception. The collected information will be used to study the influence of parental social deprivation (income, education, work, financial problems, social network), lifestyle (diet, supplement use, alcohol, smoking, illicit drug use, physical activity, stress) and use of health care on the risk of overweight, growth disorders, problems with attachment, decreased school performance and lack of social participation of their children. Eventually, results will be implemented in health care practice to reduce the disadvantage that vulnerable children are facing from early life onwards.

Study objective

The overall hypothesis of this study is that exposures before conception and in early life (embryonic and fetal period and early childhood) are associated with health outcomes in later life.
