# The impact of a nutritional supplement (Impryl®) on male fertility

Published: 12-10-2017 Last updated: 15-05-2024

To determine the effectiveness of nutritional supplement Impryl® in men of infertile couples on ongoing pregnancy rate, with or without assisted reproduction technology (ART).

**Ethical review** Approved WMO **Status** Recruiting

**Health condition type** Sexual function and fertility disorders

Study type Interventional

# **Summary**

#### ID

NL-OMON53075

## Intervention

**Keyword:** Male fertility, nutrition, ongoing pregnancy, supplement

#### **Outcome measures**

#### **Primary outcome**

Number of ongoing pregnancies, conceived in the time window between randomization up to and including month 6 of intervention use. Ongoing pregnancy is defined as a visible embryonic heartbeat at ultrasound from 10-12 weeks of gestation onwards.

## **Secondary outcome**

Secondary outcomes are number of pregnancies conceived in the optimal intervention time window (i.e. between start of month 4 till the end of month 6), overall pregnancy number, change in semen parameters between baseline and 3 months intervention in IUI/IVF/ICSI group, based on (pre-wash) total motile sperm count (TMSC). Furthermore the occurrence of pregnancy, time to pregnancy, number of miscarriages, number of ongoing pregnancies >= 20 weeks and live birth rate are documented within the study period. In a population of 80 patients, the DNA fragmentation in sperm cells will be assessed before intake of study medication and after 3 months of intake of either Impryl or placebo. The occurrence of adverse events will be reported.

# Study description

#### **Background summary**

Infertility is a worldwide problem and about 10% of all couples will be affected by the inability to have children. In approximately 50% of infertile

2 - The impact of a nutritional supplement (Impryl®) on male fertility 26-06-2025

couples a male factor is involved. In the past decade, the role of oxidative stress on sperm has been researched thoroughly and found to be the problem in 30% to 80% of male subfertility cases. Oxidative stress in the sperm cells can be measured with DNA fragmentation assays, these assay measure the level of DNA damage in the sperm cells. Impryl® is a nutritional supplement which works on the metabolic system and regulation of oxidative stress by activating the one carbon cycle and therefore recycling of homocysteine.

#### Study objective

To determine the effectiveness of nutritional supplement Impryl® in men of infertile couples on ongoing pregnancy rate, with or without assisted reproduction technology (ART).

## Study design

Multicentre, randomised double blind placebo controlled clinical trial/superiority study.

#### Intervention

Impryl® or placebo, with identical appearance one tablet each day for a total duration of 6 months. Patients can start directly to conceive or start with fertility treatment.

#### Study burden and risks

Couples with infertility will receive standard fertility treatment, i.e. EM or ART. The risks of participating in the trial are small. After a complete diagnostic work-up for infertility, the males will be randomised for use of either Impryl® or placebo. Impryl® is a food supplement already free available throughout Europe. Males need to take study medication one tablet each day for 6 months in total. For this study, we want to measure improvement of semen parameters after at least 3 months use of study medication. Performing a pre-wash TMSC is in Radboudumc standard procedure when semen is used for IUI or IVF/ICSI. However, at some sites there is only a post-wash TMSC available. Furthermore, in couples with EM performing a TMSC after 3 months is not standard care. We decided not to perform a semen analysis in the EM group due to the fact that improvement in fertility treatment from expectative management is not possible. Participants are required to collect study medication directly at their local hospital or at Radboudumc. At the start of taking study medication the couple is asked to fill in a questionnaire about their baseline characteristics. To asses lifestyle changes during intervention and amount of used study medication, every male will be asked each month (6 times in total) to fill in an online questionnaire. Every couple will receive a final questionnaire, 15 months after inclusion, about the outcome of fertility

treatment and occurrence of pregnancy.

Patients included in the Jeroen Bosch hospital will have two extra visits to the hospital - upon inclusion and after 3 months - to hand over a semen sample for the assessment of DNA fragmentation. The riks of participation for these patients is low and the burden of participation for these patients is moderate.

The risks and burden associated with participation in this trial for all other patients (except Jeroen Bosch hospital) can be considered negligible.

# **Eligibility criteria**

#### Age

Adults (18-64 years)

## Inclusion criteria

Couples with failure to conceive for at least 12 months
Couples starting with EM or 1st/ 2nd/3rd cycle of IUI (with/without ovarian

4 - The impact of a nutritional supplement (Impryl®) on male fertility 26-06-2025

stimulation) or IVF/ICSI
Male with age 18-50 years
Female partner with age 18-43 years
Willing and able to give informed consent

## **Exclusion criteria**

Planned or performed diagnostic testicular biopsy (TESE) or percutaneous epididymal sperm aspiration (PESA)

Ovulation induction (OI) without IUI

IVF for an absolute tubal factor

Embryo-transfers after cryopreservation

Known chromosomal abnormalities related to infertility

Known urological abnormality such as a varicocele

Use of other vitamin supplements
